Miraflores / Evidence Graph Workpaper

2025 Okafor-Lindqvist household • Architecture and design rationale

CORE CONCEPT

Make the review a navigable chain of proof, not a spreadsheet.
Start at any return line and traverse: computed value -> calculation rule -> source field -> source document page -> human verification -> review decision.

DATA MODEL

Case: household, tax year, jurisdictions, staff roles and assignments.
Documents/Pages: 74 records with printable simulated source views and provenance.
Extracted values: 3,012 IDs, field labels, page pointers and confidence.
Return versions/lines: v1-v3 snapshots; each line has inputs, sources and rule.
Exception/decision: severity, evidence, assignee, explanation, status and author.
Audit/signoff: role, timestamp, affected item and version-specific review state.

PRIMARY SCREENS

Overview: filing readiness, triage and current federal/California totals.
Lineage explorer: any line, upstream dependencies and clickable source field.
Evidence library: page preview, extracted values and reverse-use links.
Exception queue: reviewer resolution requires written justification.
Versions/scenarios: compare computed snapshots and engine-provided alternatives.
Workflow: role switcher, review gates and season-long filing timeline.

ENGINEERING TRADEOFFS

Delivered as a self-contained browser prototype, with local review persistence.
Embedded case packet enables offline use without installation or credentials.
No live recalculation: scenario tax effects use supplied precomputed alternatives.
For production: server RBAC, append-only audit log, database, secure object storage, collaborative updates, upload pipeline, e-file controls and hosted deployment.

AI DISCLOSURE

AI assisted with architecture, implementation and exception discovery.
Candidate tax issues require independent CPA review before resolution.
